Environmental Report
BMW iX3

Abstract

Goal and scope:
The scope of the study is the life cycle assessment of the BMW iX3, Model Year 2020. Its purpose is to assess the environmental impacts of the entire vehicle and its components according to the product responsibility strategy of the BMW Group. These results are important for the further development and optimization of the next BMW X3 BEV generation.

System boundaries:
The system boundaries consist of all material and energy flows, input and output collected according to ISO 14040 with the following level of detail:

- From sourcing and production of raw materials to production, to use phase, to recycling (incl. transport logistic).
- Use phase: assumed mileage 200,000 km, consumption according to worldwide harmonized test procedure (WLTP).
- Material data from material balance of the BMW iX3.
- The impact assessment is based on the CML-method (January 2016) developed at Leiden University in the Netherlands (Guinée and Lindeijer 2002).
- A critical review of the environmental report is done by an external auditor.
- The compilation and assessment process was verified by TÜV Rheinland assessing compliance with the internal process description as well as verifying data and environmental information used (validation attached).
The functional unit and the reference flow are defined as the BMW iX3 vehicle as an ECE-basis version with a use phase of 200,000 km according to the WLTP at SOP (start of production) in 2020. The eDrive system enhancements bring the electric motor, electronic systems and transmission into one central unit. The high-voltage battery (lithium-ion technology) powers the electric motor.

**Fig. 1:** Flowchart input / output data of the BMW iX3

The LCA according to ISO 14040/44 refers to environmental aspects and potential environmental impacts along the life cycle of a product from the raw material extraction to the manufacturing process, to the use phase, and to the recycling at the end of the vehicle’s life.
Facts:
The life cycle assessment (LCA) of the BMW iX3 shows the following environmental impacts across the whole life cycle in terms of Global Warming Potential (GWP) (fig. 2). The environmental impacts determined by the life cycle assessments are measured in different units. The GWP, for example, is stated in kilogram CO₂-equivalents (kg CO₂e).

* renewable charging power

**Fig. 2:** Distribution of global warming potential over life cycle of BMW iX3 in relation to the conventional X3 30i

Sensitivity analysis:
A sensitivity analysis of different scenarios was carried out for estimating the effect of the choices made regarding methods and data on the results of the study.

Examples of the scenarios considered in the sensitivity analysis are:
- Influence of the data robustness on the life cycle assessment results.
- Influence of the different consumption and electricity availability scenarios during use phase.
- Classification of the BMW iX3 in relation to conventional vehicle concepts.
Thanks to the use of BMW EfficientDynamics and eDrive technology, the Global Warming Potential of the iX3 is about 40% lower than of the conventionally powered X3 30i across the whole life cycle. If renewable energy sources are used for charging, the reduction is at about 67% (fig. 3).
Validation

TÜV Rheinland LGA Products GmbH confirms that a critical review of the life cycle assessment (LCA) study of BMW AG, Petuelring 130, 80788 München for the following passenger car:

BMW iX3 – 2020 model year

was performed.

Proof has been provided that the requirements of the international standards:

are fulfilled.

Results:

- The LCA study was carried out according to the international standards ISO 14040:2006 and ISO 14044:2006 + Amd 1:2017. The methods used and the modelling of the product system correspond to the state of the art. They are suitable to fulfill the goals stated in the study. The report is comprehensive and provides a transparent description of the framework of the LCA study.
- The assumptions used in the LCA study especially fuel consumption based on the current WLTP (Worldwide harmonized Light vehicles Test Procedure) were verified and discussed.
- The assessed samples of data and environmental information included in the LCA study are plausible.

Review process and level of detail:

Verification of input data and environmental information as well as the check of the LCA process was performed in course of a critical data review. The data review considered the following aspects:

- Check of the applied methods and the product model,
- Inspection of technical documents (e.g. type approval documents, parts lists, supplier information, measurement results, etc.) and
- Check of LCA input data (e.g. weights, materials, fuel consumption, emissions, etc.).

Cologne, 15. October 2020

Norbert Heidelmann
Department Manager for Carbon and Energy Services

Responsibilities:
Solo liability for the content of the LCA rests with BMW AG. TÜV Rheinland LGA Products GmbH was commissioned to review said LCA study for compliance with the methodological requirements, and to verify and validate the correctness and credibility of the information included therein.
